Abstract:

Now-a-days dashboards are more pronounced in business world since it facilitates deep investigation on the sales scenario. But has anyone given a thought of bringing in this excellence into Mainframes? Is it possible in the user interface of mainframe? In this paper, we have provided a business solution to increase the sales percentage of a company by implementing the dashboard strategy in mainframes. The technicalities present behind the performance of the officers are taken into consideration and the same are used to depict a dynamic graph thereby making it visually strong. The traversal between graphs is achieved through drill up and drill-down approach. This approach elevates the level of user interface in Mainframes.
